(54) Hair coloring composition.

(57) A two part aqueous composition for coloring and providing durable conditioning to human hair which forms a gel on mixing of an alkaline aqueous lotion first part having a pH of from about 7 to about 11 containing from about 0.005% by weight to about 5% by weight of at least one primary intermediate and at least one coupler for the formation of oxidation dyes, from about 0.1% to about 5% of a cationic polymer, from about 0.5% to about 15% by weight of an anionic or amphoteric surfactant or mixture thereof and at least 70% by weight water, and an aqueous developer second part having a pH of from about 2 to about 6 containing from about 0.5% by weight to about 40% by weight of a peroxide oxidizer and from about 0.1% by weight to about 20% by weight of an anionic polymer, the anionic polymer being characterized in that it is insoluble in the developer and dissolves in the gel which forms when the lotion and developer are mixed.

EP 0 640 335 A2

FIELD OF THE INVENTION

This invention relates to oxidative, aqueous, hair coloring compositions.

5 BACKGROUND OF THE INVENTION

When oxidation dyes of the type comprising primary intermediates and couplers are used in the dyeing of human hair, the procedure usually involves the use of a two part system. One part is the lotion formulation which contains a variety of ingredients, including the oxidation dye precursors, and forms a gel 10 immediately prior to application to the human hair, when mixed with the second part, the developer formulation containing a suitable oxidizing agent. The developer usually contains an oxidizing agent, such as hydrogen peroxide and as a consequence some of the natural melanin pigment of the hair may be initially destroyed. The precursors in the lotion penetrate into the hair and are oxidized to produce the desired color. Such systems will generally contain 50% or more of organic solvents and surfactants, and 15 require relatively high levels of dye precursors to produce the desired color.

Several conditions are important for the procedures using oxidative dyes to work properly. These include:

1. The formulations must be stable to insure a reasonable shelf life.
2. The compositions formed by mixing the lotion and developer must have rheological properties 20 whereby application, either by use of a brush or with the fingers, can readily distribute the dye throughout the hair mass and yet in the absence of stress, dripping or running from the hair during the color development period can be substantially avoided.
3. The dye mixture, as applied to the hair, should allow rapid diffusion of the dye precursors from the dye mixture into the hair fiber.
4. The mixture, while thick enough to stay in place during the color development period should be 25 readily rinseable from the hair with water.
5. The mixture should preferably contain conditioning agents which leave the hair in a condition such that it is easy to detangle while wet and also feel smooth and be readily managed when dry.
6. The lotion and developer should preferably, but not necessarily, have comparable viscosities in order 30 to facilitate mixing.
7. The dyeing effect should be rapid, with a dyeing time preferably under thirty minutes.

In conventional permanent hair dye products, the rheological properties have generally been attained by the use of a dye lotion containing a high level of surfactants and organic solvents to provide a thin lotion which, on mixture with a highly aqueous developer solution of the oxidizing agent forms a dye mixture with 35 the desired gel-like consistency. The disadvantage of this approach is that the dye mixture still contains a high level of surfactants which tend to retard the diffusion of the dye precursors into the hair. The preferred surfactants in commercial products have been nonionic or anionic materials which do not provide any conditioning. The preferred conditioners for human hair are cationic surfactants which provide excellent conditioning but are incompatible with anionic surfactants.

40 There have been many efforts to produce oxidative hair dyeing compositions having the desired properties, listed above, while at the same time avoiding the aforesaid problems.

U.S. Patents 3,303,213; 3,331,781; 3,436,167 and 3,891,385 describe the use in hair treating compositions of specific amphoteric surfactants such as the sodium salt of N-(N<sup>1</sup>,N<sup>1</sup>-dimethyl-aminopropyl)-N<sup>2</sup>-alkyl (fatty) asparagine wherein the "fatty" moiety is derived from the fatty acids of tallow. According to the 45 patents, the amphoteric surfactant can be employed with organic solvents and any of a variety of cationic, anionic or non-ionic surface active agents. There is no indication of the use of quaternary ammonium salts in the compositions.

U.S. Patent 4,402,700 describes hair dyeing compositions containing quaternary ammonium compounds and also cites the possible uses of amphoteric surfactants in the compositions. These compositions, however, require the uses of organic solvents and nonionic surfactants, and the amount of water in the 50 compositions is less than 50%.

U.S. Patent 4,532,127 describes hair coloring compositions containing oxidative dyes together with an oxidizing agent. The compositions require the presence of quaternary amine compounds containing two long chain alkyl radicals each having about 10 to 26 carbon atoms. Any of a variety of surfactants may be present in the composition which, although they have a high water content may contain organic solvents. The lotions of the patent contain di-long chain alkyl quaternary ammonium compounds in the presence of relatively large amounts of non-ionic surfactants. They are said to be superior to a comparison lotion containing a mono-long chain alkyl quaternary ammonium compound in combination with an amphoteric

surfactant. The lotions of this patent suffer from the disadvantage of having high levels of surfactant thus inhibiting rapid diffusion of the dye precursors into the hair. Furthermore, di-long chain alkyl quaternary ammonium are poorly biodegradable, particularly as compared to the mono-long chain alkyl quaternary ammonium compounds. The compositions disclosed are free of anionic surfactants and anionic polymers.

5 U.S. Patent 4,663,158 describes hair conditioning compositions containing an amphoteric surfactant together with at least one quaternary cationic polymer such as poly (methacrylamidopropyl)trimethyl ammonium chloride. The compositions are acidic.

U.S. Patent 4,563,188 discloses hair dyeing compositions containing specific para-phenylenediamine derivatives which may contain any of several types of surfactants as well as organic solvents.

10 U.S. Patent 5,137,538 describes oxidative hair dyeing compositions containing specific para phenylenediamines and N,N' diphenylalkylenediamines. The compositions may be acidic or alkaline. They may contain organic solvents and anionic, cationic, non-ionic or amphoteric surfactants.

15 U.S. Patent 4,362,528 refers to compositions said to be useful for hair coloring. These compositions comprise oxidative dyes together with any of a variety of cationic polymers. The hair is first treated with such composition and subsequently rinsed with a shampoo composition containing an anionic detergent.

U.S. Patent 3,986,825 refers to a variety of hair coloring composition which may be employed with either oxidizing agents or reducing agents and which employ any of a wide variety of surfactant water soluble polymer additives together with anionic, cationic, nonionic or amphoteric surfactants.

20 US Reissue Patent 33786 teaches that rapid dyeing with highly aqueous compositions can be achieved through the use of a certain acrylate copolymer viz an acrylate/steareth-20 methacrylate copolymer in the developer. Such polymers produce a thickening effect only when the developer is added to the alkaline lotion containing the color precursor. The disadvantage of the use of acrylate copolymers, or any other anionic polymer, as used in this patent is that they tend to deactivate quaternary ammonium conditioning compounds by complexation. Furthermore, products containing a simple aqueous acrylate system are 25 difficult to rinse from the hair. Additionally, experience has shown that lotions and developers containing the specific anionic copolymer of USRe33786 are difficult to formulate in that the viscosity of the resulting mixture is not readily controllable.

25 U.S. Patent 4,240,450 describes hair treating mixtures such as shampoos and hair coloring compositions which may be oxidative. The compositions include cationic and anionic polymers which may be chosen from hundreds of such polymers which are generically and specifically described.

30 It is an object of this invention to provide stable hair dyeing compositions which avoid the aforesaid problems while at the same time providing rapid dyeing permanent hair coloring systems having excellent rheological properties. The compositions of the invention are readily rinseable from the hair at the completion of the color development stage and leave the hair in excellent condition without the need of an anionic shampoo as a post-dyeing step.

35 It is a further object of the invention to provide lotions and developers which can be readily formed into a gelled mixture having an appropriate viscosity to remain on the hair for a sufficient period to achieve the desired hair coloring effect.

40 It is yet another object of this invention to provide a two part composition which contains substantially lower amounts of surfactants than has generally been heretofore employed.

45 It is a still further object of this invention to provide hair coloring compositions which also impart a durable conditioning effect to treated hair and which markedly improves its combability without the need of an anionic shampoo as a post-dyeing step.

#### 45 BRIEF SUMMARY OF THE INVENTION

This invention comprises a two part system comprising aqueous, oxidative, hair coloring compositions (lotions and developers) for mixture with each other shortly before use to form a gel. The lotion comprises an aqueous alkaline composition having a pH of from about 7 to 11 and a water content of at least about 50 70% by weight, a tinctorily effective amount of oxidative dye precursors, at least one anionic or amphoteric surfactant or mixture thereof and at least one cationic polymer. The second part, i.e. the developer is an aqueous composition with a pH of from about 2 to about 6, preferably 2.5 to 4.5. It contains a peroxide oxidizing agent and at least one substantially water insoluble anionic acrylic polymer which is solubilized on admixture of the lotion and developer.

DETAILED DESCRIPTION OF THE INVENTION

The components in the aqueous first part of the compositions of this invention, i.e. the lotion, include water, the oxidizable dye precursors, an anionic or amphoteric surfactant or mixture thereof and a cationic polymer.

5 The water content of the composition is at least about 70% by weight and may be as high as 95% or higher.

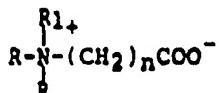

Unless otherwise specified the amounts of the various ingredients in the compositions of this invention are in percent by weight based on the total weight.

10 Suitable anionic surfactants include, for example, the following: the alkali metal, ammonium, or amine salts of alkyl sulfates, alkyl ether sulfates, linear alpha-olefin sulfonates, dialkyl sulfosuccinates, alkylamidosulfosuccinates, and alkyl taurates each having from about C-12 to C-18 alkyl or alkenyl groups. Particularly preferred are the salts of lauryl sulfates and lauryl ether sulfates the latter having an average level of ethoxylation of 1-3.

15 Amphoteric surfactants belong to the category of surface active chemicals that possess a positive and a negative charge in the same molecule and behave as a cation or an anion depending on the pH of the medium. In general, the positive charge is located on a nitrogen atom while the negative charge is carried by a carboxyl or sulfonate group. There are a large number of amphoteric surfactants that are suitable for use in this invention. They include, for example, the asparagine derivatives identified in the first three 20 patents mentioned above as well as a variety of well known betaines, sultaines, glycinate and propionate which may be represented by the following structural formulas:

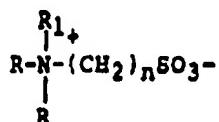

25

## 1. Betaines:

30

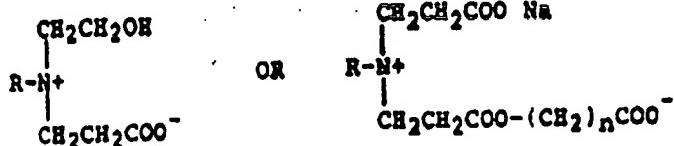

## 2. Sultaines:

35

40

## 3. Propionates:

45

50

## 4. Glycinates:

In the formulas, R is an alkyl or alkylamido group containing from about 10 to about 20 carbon atoms, R<sub>1</sub>, R<sub>2</sub> and R<sub>3</sub> are alkyl or hydroxyalkyl groups, which may be the same or different, and contain up to about five carbon atoms and n is a positive integer up to about five.

Typical amphoteric surfactants that are suitable for use in this invention include:

- 5 Lauryl betaine, lauroamphoglycinate, lauroamphopropylsulfonate, lauroamphopropionate, lauroamphocarboxyglycinate, lauryl sultane, myristamidopropyl betaine, myristyl betaine, myristoamphoglycinate, myristyl propionate, stearoamphoglycinate, stearoamphopropionate, stearoamphopropylsulfonate, stearyl betaine, cocamidoethyl betaine, cocamidopropyl betaine, cocamidopropyl hydroxysultane, cocamidopropyl dimethylamine propionate, cocoamphoglycinate, cocoamphocarboxypropionate, cocoamphocarboxyglycinate, coco-betaine, cocoamphopropionate, cocoamphopropylsulfonate.

The anionic and amphoteric surfactants and mixtures of these surfactants for use in this invention may be selected from any of a number of known surfactants. The amount of such surfactants in the compositions is normally from about 0.5% to 15% by weight, preferably 2% to 8% by weight.

The amphoteric surfactants presently preferred for use in this invention are:

- 15 Cocamidopropyl betaine, coco-betaine, stearly betaine, cocoamphocarboxyglycinate, cocoam-  
phodipropionate, and stearoamphoglycinate.

The pH of the lotions of this invention will generally be from about 7 to about 11. It is preferred, however, that this pH be in the range of 7.5 to 9.5.

Any of a wide variety of alkaline agents can be used to adjust the pH of the hair coloring compositions.

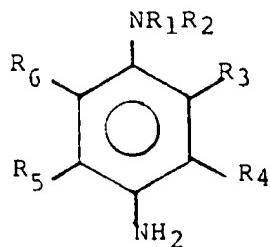

- 20 Anmonium hydroxide, because of its freedom from toxicity over a wide concentration range and its economy, is an acceptable alkalizing agent. However, there can be used in place of, or together with, ammonium hydroxide any other compatible ammonia derivative as an alkalizing agent, such as an alkylamine, for example ethylamine, or triethylamine; or alkanolamines, for example ethanolamine, diethanolamine, aminomethyl propanol, aminomethyl propanediol and trishydroxymethyl aminomethane.

25 Likewise, any other of the organic or inorganic alkalizing agents may be used, such as sodium or potassium hydroxide, sodium or potassium carbonate, sodium phosphate, sodium hydrogen phosphate, sodium silicate, guanidine hydroxide and the like. The preferred alkaline reagents are ammonium hydroxide, sodium carbonate and ethanolamine.

With the agents listed above, the selected pH will generally be achieved if the lotion contains from about 0.1% to 5% by weight of alkaline agent.

The oxidative dye precursors employed in the practice of this invention comprise one or more primary intermediates together with one or more couplers. The selection of specific intermediates or couplers determines the ultimate color of the treated hair. Such selection is not a critical aspect of the practice of the invention.

- 35 A wide variety of primary intermediates can be employed in this invention including, for example: paraphenylenediamines, corresponding to the formula:

- 50 in which  $R_1$  and  $R_2$ , which may be identical or different, can denote hydrogen, a  $C_1$ - $C_6$  lower alkyl group, a  $C_1$ - $C_6$  alkyl radical substituted with one or more hydroxy group(s) or with a methoxy, methylsulphonylamino or aminocarbonyl group, a furfuryl group, or a phenyl radical optionally substituted with an amino group,  $R_3$  and  $R_5$  denote, independently of one another, hydrogen, a  $C_1$ - $C_6$  lower alkoxy group, a halogen atom such as a chlorine atom, a  $C_1$ - $C_6$  lower alkyl group, or a  $C_1$ - $C_6$  lower alkyl group substituted with one or more hydroxy group(s), and  $R_4$  and  $R_6$  denote, independently of one another, hydrogen, a  $C_1$ - $C_6$  lower alkoxy group, a  $C_1$ - $C_6$  lower alkyl group, or a halogen atom such as chlorine, as well as their salts with inorganic or organic acids;  $N,N'$ -diphenylalkylenediamines in which the phenyl groups are substituted at the para position with an OH or amino group optionally substituted with a  $C_1$ - $C_6$  alkyl group, it being possible for the

55

amino groups joined by the alkylene group to be substituted with C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> hydroxyalkyl or C<sub>1</sub>-C<sub>6</sub> aminoalkyl; para-aminophenols; ortho-aminophenols; ortho-phenylenediamines, and heterocyclic oxidation bases.

Among the useful compounds of the formula shown above, there may be mentioned p-phenylenediamine, 2-methyl-paraphenylenediamine, 2-methoxy-p-phenylenediamine, 2-chloro-N-methyl-paraphenylenediamine, N-furfuryl-p-phenylenediamine, 3-methoxy-N<sup>1</sup>-methyl-paraphenylenediamine, 2-chloro-p-phenylenediamine, N-methyl-p-phenylenediamine, 2,3-dimethyl-p-phenylenediamine, 5-chloro-N<sup>1</sup>-methyl-p-phenylenediamine, 5-methyl-N<sup>1</sup>,N<sup>1</sup>-dimethyl-p-phenylenediamine, 5-methyl-N<sup>1</sup>-ethyl-N<sup>1</sup>-(amino-carbonyl-methyl)-p-phenylenediamine, 5-methyl-N<sup>1</sup>-ethyl-N<sup>1</sup>-ethylsulphonylaminoethyl)-p-phenylenediamine, N-(2-methoxy-ethyl)-p-phenylenediamine, 2,6-dimethyl-p-phenylenediamine, N,N-bis(2-hydroxyethyl)-p-phenylenediamine. The N,N'-diphenylalkylenediamines include, for example, N,N'-bis(2-hydroxyethyl)-N,N'-bis(p-aminophenyl)ethylenediamine. Their salts with acids such as the monohydrochlorides dihydrochlorides or sulphates are also suitable.

Among p-aminophenols which are usable according to the invention, there may be mentioned p-aminophenol, 2-methyl-p-aminophenol, 3-methyl-p-aminophenol, 2,3-dimethyl-p-aminophenol, 2,6-dimethyl-p-aminophenol, 3-methoxy-p-aminophenol, 2-chloro-p-aminophenol, N-methyl-p-aminophenol and 3-(methylthio)-p-aminophenol, of which p-aminophenol is preferred.

Among ortho bases, ortho-aminophenol, 5-chloro-orthoaminophenol and ortho-phenylenediamine are chosen more especially according to the invention.

Among heterocyclic bases, it is preferable, according to the invention, to use 2,3-diamino-6-methoxy-pyridine and 2-(2-hydroxyethyl)amino-5-aminopyridine and their salts, and still more especially 3,6-diaminopyridine, 2,6-dimethoxy-3-amino-pyridine, 2-methylamino-3-amino-6-methoxypyridine, 2,5-diaminopyridine, 2-(N-hydroxyethyl)amino-5-amino-pyridine, and 2-(N,N-bishydroxyethyl)amino-5-aminopyridine.

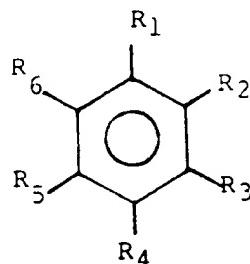

More especially preferred primary intermediates are p-phenylenediamine, 2-methyl-p-phenylenediamine, N-(2-methoxyethyl)-p-phenylenediamine, N,N-bis(2-hydroxyethyl)-p-phenylenediamine and p-aminophenol.

Among couplers or color modifiers there may be mentioned, in particular, the compounds corresponding to the formula:

30

35

40

in which R<sub>1</sub> denotes hydroxy or an amino group which can be substituted with one or more C<sub>1</sub>-C<sub>6</sub> hydroxyalkyl groups; R<sub>3</sub> and R<sub>5</sub>, independently of one another, can denote hydrogen, a hydroxy group, an amino group optionally substituted with a C<sub>1</sub>-C<sub>6</sub> lower hydroxyalkyl group or a C<sub>1</sub>-C<sub>6</sub> lower alkyl group; and R<sub>2</sub>, R<sub>4</sub> and R<sub>6</sub> can denote a hydrogen atom or a C<sub>1</sub>-C<sub>6</sub> alkoxy group, a hydroxyalkoxy group or a C<sub>1</sub>-C<sub>6</sub> lower alkyl group; it also being possible for R<sub>3</sub> and R<sub>4</sub> together to form a methylenedioxy group.

Among the suitable couplers, there may be mentioned 2-methoxy-5-aminophenol, 2-methoxy-5-[N-(2-hydroxyethyl)amino]phenyl, 1,3-diamino-2,6-dimethoxybenzene, 2-methoxy-1-(N-methylamino)-4-(2-hydroxyethoxy)-3-aminobenzene, 1,3-diamino-6-methoxybenzene, 1,3-diamino-4,6-dimethoxybenzene, 2,6-dimethoxy-1,3-bis[N-(2-hydroxyethyl)-amino]benzene, 2,6-dimethoxy-3-[N-(2-hydroxyethyl)amino]-1-aminobenzene, 2,6-dimethoxy-3-[N-(2-hydroxyethyl)amino]-1-aminobenzene, 2,4-dimethoxy-3-[N-(2-hydroxyethyl)amino]phenol, 1,3-bis[N-(2-hydroxyethyl)amino]-4-methoxybenzene, 3-amino-4-methoxyphenol, 3,4-methylenedioxy-1-aminobenzene, 2,6-dimethyl-3-[N-(2-hydroxyethyl)amino]phenol, 2,6-dimethyl-3-aminophenol, 4-ethoxy-1-amino-3-[N,N-bis(2-hydroxyethyl)amino]benzene, (2,4-diaminophenoxy)ethanol, (2-amino-N-methyl-4-aminophenoxy)-ethanol, 1-methoxy-2-[N-(2-hydroxyethyl)amino]-4-aminobenzene, 3,4-methylenedioxy-6-methoxyphenol, 3-amino-6-methylphenol, 3,4-methylenedioxy-6-methoxyaminobenzene, 3-aminophenol, 1,3-dihydroxybenzene-4-(hydroxyethoxy)-1,3-phenylenediamine, 4,6-(dihydroxyethoxy)-1,3-phenylenediamine, and 1,3-phenylenediamine.

- Other suitable couplers are 6-aminobenzomorpholine, 1-amino-7-naphthol, 6-hydroxybenzomorpholine, 1-naphthol, 1,3-dihydroxynaphthalene and 1,2-dihydroxy-benzene. Among heterocyclic couplers there may be mentioned 2,6-dihydroxypyridine, 2,6-diaminopyridine, 2-amino-4-hydroxypyridine, 2-hydroxy-4-amino-pyridine, 2-hydroxy-5-aminopyridine, 2-amino-6-hydroxypyridine and the like. Included also are further derivatives of 2,6-diamino alkyl pyridines where the amino nitrogen of one or both amino groups is mono- or distributed with a C<sub>1</sub>-C<sub>6</sub> alkyl group such as the methyl, propyl, isopropyl, butyl, iso or sec-butyl, pentyl, sec-pentyl neopentyl, t-butyl, hexyl, 3-methyl pentyl or 4-methylpentyl groups. The amino groups of either the amino-4-hydroxy- or 2-hydroxy-4-amino-pyridines may also have mono- or di-C<sub>1</sub>-C<sub>6</sub> alkylation on the nitrogen atoms.
- The 2,6 amino-, or 4-amino-2-hydroxy- or 2-amino-4-hydroxy pyridine nitrogens may also either singly or doubly be derivatized with alkoxy substituents of carbon lengths of 1 to 6 with specific mention of 2-hydroxyethyl, 3-hydroxypropyl, 4-hydroxybutyl, 5-hydroxypentyl, 6-hydroxyhexyl, 2-hydroxypropyl, 2-hydroxybutyl, 2-hydroxypentyl, 2-hydroxyhexyl, 3-hydroxybutyl, 3-hydroxypentyl, 2-hydroxyhexyl, 4-hydroxypentyl and 5-hydroxypentyl groups.
- Among trihydroxylated derivatives of benzene, there may be mentioned 1,2,4-trihydroxybenzene, 1,2,4-trihydroxy-5-alkylbenzenes in which the alkyl group is a C<sub>1</sub>-C<sub>6</sub> lower alkyl group and 1,2,3-trihydroxybenzene, and their salts.
- Among diaminohydroxybenzenes, there may be mentioned 2,4-diaminophenol and 2,5-diamino-4-methoxy-1-hydroxybenzene, and their salts.
- Among aminodihydroxybenzenes, there may be mentioned 2-amino-1,4-dihydroxybenzene, 1,4-dihydroxy-4-diethylaminobenzene and 4-aminoresorcinol, and their salts.
- Among substituted 1,2-dihydroxybenzenes, 4-methyl-1,2-dihydroxybenzene and 3-methoxy-1,2-dihydroxybenzene are especially preferred.
- The aminohydroxybenzenes are chosen, in particular, from 2-amino-4-methoxyphenol, 2-aminophenol, 4,6-dimethoxy-3-amino-hydroxybenzene and 2,6-dimethyl-4-[N-(p-hydroxyphenyl)amino]-1-hydroxybenzene, and their salts.
- By way of a triaminobenzene, there may be mentioned 1,5-diamino-2-methyl-4-[N-(p-hydroxyphenyl)-amino]-benzene and its salts.

The table below lists some of the preferred primary intermediates and couplers for use in this invention.

30

#### Preferred Primary Intermediates and Couplers

35

Primary Intermediates:	p-phenylenediamine p-aminophenol o-aminophenol N,N-bis(2-hydroxyethyl)-p-phenylenediamine 2,5-diaminopyridine p-toluenediamine
40 Couplers:	resorcinol 1-naphthol 5-amino-o-cresol 2-methylresorcinol 4,6-di(hydroxyethoxy)-m-phenylenediamine m-phenylenediamine
45	

50

The primary intermediate(s) and coupler(s) in the aqueous lotion of the invention will normally be employed in equimolar quantities, each at a concentration of about 0.0005% to about 5% by weight, preferably 0.005% to 2.5% by weight.

55

The selection of the cationic polymer for use in the lotion of this invention is critical as is the selection of the anionic polymer for use in the developer. The test to determine the suitability of the cationic polymer with any selected anionic and/or amphoteric surfactant employed in the lotion is to mix the candidates in water at a pH above 7. If an insoluble precipitate forms which does not readily dissolve on the addition of more of the surfactant, then the combination is suitable for use in this invention.

The anionic polymer for use in the developer will be described in somewhat more detail supra. It is, however, selected on the basis of its insolubility in the developer and the fact that it dissolves to form a gel when the lotion and the developer are mixed.

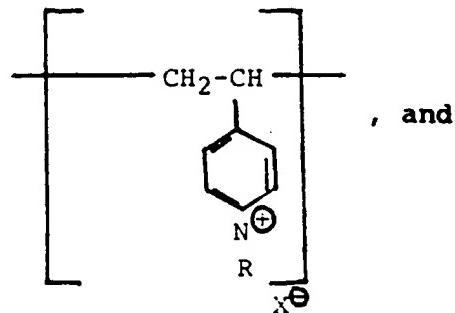

The presently preferred cationic polymers are quaternary polymers of diallyldialkylammonium salts in which the alkyl groups are the same or different and contain from 1 to 5 carbon atoms such as Merquat 100 (Calgon) or copolymers of the above with acrylic acid sold under the names Merquat 280 and Merquat 295, such as those described in U.S. 4,772,462. Surprisingly, it has been observed that the copolymers of 5 diallyldialkylammonium salts with acrylamide, such as that sold under the name Merquat 550, are unsuitable for this purpose.

Other useful polymers include Onamer M (Onyx) a polydimethylbutenyl chloride end-capped with Hydroxyalkyl groups of the formula:

$R_3N [CH_2CH=CH-CH_2N(CH_3)_2]_n CH_2CH=CHCH_2NR_3$  where  $R_3$  is a hydroxyalkyl group having 1-5 10 carbon atoms, preferably 2.

Quaternized polyvinylpyridine where R is alkyl or hydroxyalkyl having 1-5 carbon atoms and X is an anion such as chloride, bromide sulfate or alkylsulfate of the formula:

15

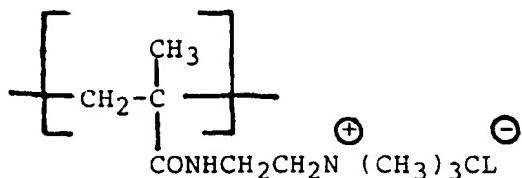

20

25

Polymethacrylamidopropyltrimethylammonium chloride

30

35

are also useful.

The viscosity of the completely formulated lotion of the invention, when it is ready to mix with the 40 developer, is from about 1 cps to about 5000 cps, preferably 1 cps to 500 cps.

The lotion may contain organic solvents to assist in dissolving the dye precursors. However, it has been observed that in the compositions of this invention, the organic solvent content should be kept at a minimum. More solvent than is necessary to dissolve the precursors may have the effect of retarding diffusion of the precursors into the hair for reaction. Accordingly, the organic solvent content of the lotion 45 may be from 0% by weight to about 5% by weight.

Typically useful solvents include alcohols containing up to three carbon atoms such as ethanol and isopropanol, polyhydroxy alcohols such as propylene or hexylene glycol and lower alkyl ethers thereof such as ethoxy ethers.

Other conventional agents often employed in hair coloring compositions may be employed in the lotion 50 or in the developer. These include, for example, fragrances, coloring agents and chelating agents. Antioxidants such as sodium sulfite erythorbic acid and ascorbic acid may also be included to inhibit premature oxidation.

The oxidising composition or developer employed in the invention is an acidic aqueous composition 55 which comprises the selected oxidizing agent together with one or more anionic polymers which are insoluble in water.

The preferred oxidizing agent for use in the developer of the invention is hydrogen peroxide although other peroxides may be employed. These include, for example, urea peroxide, melamine peroxide, perborates and percarbonates such as sodium perborate or percarbonate. The concentration of peroxide in

the developer may be from about 0.5% to about 40% by weight, preferably 0.5% to 30% by weight. If the preferred hydrogen peroxide is employed, the concentration will be from about 0.5% to about 12% by weight, preferably 3% to 9% by weight.

5 An important aspect of the practice of this invention is the selection of the anionic polymer for use in the developer. It should be stable to the peroxide oxidant, insoluble in the developer and, when the developer is mixed with the lotion, assist in the formation of a gel in which the anionic polymer is soluble.

Typically useful polymers employed in the invention include copolymers of acrylic acid and acrylic esters such as those sold under the trade mark Aculyn by Rohm and Haas Company. These polymers are insoluble in the developer solution and form a gel when the developer is added to the alkaline dye lotion.

10 The presently preferred anionic polymer is an alkali soluble polymer available from Rohm and Haas, Philadelphia, Pa., under the trade mark Aculyn 33. It is believed to be a copolymer of acrylic or methacrylic acid with their lower alkyl esters.

The concentration of anionic polymer in the developer is from about 0.1% by weight to about 20% by weight, preferably 0.5% to 10% by weight.

15 The developer and/or the lotion may also contain from 0 to about 0.2% by weight of a stabilizer such as phenacetin or ethylene diamine tetracetic acid (EDTA).

The viscosity of the developer as prepared for mixture with the lotion is from about 1 cps to about 5000 cps by weight, preferably 1 cps to 500 cps by weight.

20 It is desirable but not essential that the viscosities of the lotion and the developer be close to each other. If the difference in viscosities is too great they will be difficult to mix. On shaking the thinner solution will agitate well, but the thicker component will be more difficult to agitate and the rate of blending will be slowed down.

The pH of the developer is from about 2 to about 6, preferably 2.5 to 4.5. Any of a variety of non-toxic acids or buffers may be employed to maintain pH. Phosphoric acid is the most preferred.

25 The lotion and developer are mixed just before application to the hair. On the hair, they form a stable gel with enough consistency and body to remain on the hair during the complete coloring period without dripping or running. The primary intermediate and coupler, i.e. the dye precursors diffuse rapidly into the hair together with the oxidizing agent. The dyes form within the hair fiber and, since they are large molecules, remain in the hair so that the color change is permanent. The term "permanent" means that the 30 dye does not readily wash out of the hair with ordinary shampoos. The color achieved with the products of this invention is so stable that it may survive as many as 20 shampoos without noticeable change.

At the end of the coloring period, the composition is washed from the hair with an ordinary water rinse followed by a shampoo.

35 The compositions of this invention may be separately provided in a kit or package form ready for mixing by the user, either professional or personal, to initiate the dyeing process. It is preferred to mix them in a mixing vessel for subsequent application to the hair as the gel forms.

The kit provided in accordance with this invention comprises those containers. In the most convenient form, there will be two containers, one containing the lotion, the other the developer. Particularly when a solid oxidant is employed, it may be convenient to package the developer in separate containers one with 40 the oxidizing agent, the other with the anionic polymer in water. With both embodiments of the invention, the ingredients in the aqueous composition of the first container will include the dye precursors, the anionic and/or amphoteric surfactant and the cationic polymer all in the amounts defined above.

The method of the invention comprises applying the mixture to the hair to be colored and allowing it to remain in contact with the hair until the desired hair color has been attained after which the composition is 45 removed from the hair as described above.

The following non-limiting examples are given by way of illustration only.

#### EXAMPLES 1-40

50 The lotions and developers shown below are prepared by mixing the separate components. When these 5 lotions are separately mixed with either of the 2 developers, 10 different gelled hair coloring compositions are prepared which color human hair when applied thereto and thoroughly incorporated in the hair by finger manipulation.

DYE LOTION EXAMPLES		1	2	3	4	5
5	p-Phenylenediamine	0.020	1.100		0.100	0.200
	N,N-Bis(2-Hydroxyethyl)-p,p,d. Sulfate		0.500			0.100
	p-Aminophenol			0.350		0.100
	Resorcinol	0.030	2.000		0.080	0.300
10	2-Methylresorcinol			0.200		
	m-Aminophenol		0.400	0.200	0.020	0.200
	1-Naphthol	0.010				0.100
	Sodium Sulfite	0.100		0.200		0.200
	Erythorbic Acid	0.200				0.400
	EDTA	0.020		0.010		0.020
15	Polyquaternium 22	2.000				2.000
	Polyquaternium-1		4.000			
	Polyquaternium-6			5.000		
	Polymethacrylamidopropyl Trimonium Chloride				4.500	2.000
	Hexylene Glycol	3.500				3.000
20	Ethoxydiglycol		3.000			
	Propylene Glycol		2.000	4.000		
	Sodium Laureth Sulfate	1.000				
	Sodium Lauryl Sulfate				2.000	4.000
	Cocoamphopropionate			4.000		
25	28% Ammonia	7.000			11.000	
	Monoethanolamine		9.000			
	Aminomethylpropanol			10.000		
	Lactic Acid		1.000			
	Oleic Acid				5.000	
30	Water	86.120	77.000	76.040	74.300	77.880

DEVELOPER EXAMPLES			
	1	2	
35	Hydrogen Peroxide	6.000	3.000
	Aculyn-33	6.200	6.700
	Disodium EDTA		0.100

## 45 Claims

1. A two part aqueous composition for coloring and providing durable conditioning to human hair which forms a gel on mixing of the two parts comprising:
  - a: an alkaline aqueous lotion having a pH of from about 7 to about 11 containing from about 0.005% by weight to about 5% by weight of at least one primary intermediate and at least one coupler for the formation of oxidation dyes, from about 0.1% to about 5% of a cationic polymer, from about 0.5% to about 15% by weight of an anionic or amphoteric surfactant or mixture thereof and at least 70% by weight water; and
  - b: an aqueous developer having a pH of from about 2 to about 6 containing from about 0.5% by weight to about 40% by weight of a peroxide oxidizer and from about 0.1% by weight to about 20% by weight of an anionic polymer, the anionic polymer being characterized in that it is insoluble in the developer and dissolves in the gel which forms when the lotion and developer are mixed.

2. A composition as in claim 1 wherein:
  - a: the pH of the lotion is from 9.0 to 10.5, the primary intermediate and coupler content is from 0.005% to 2.5% by weight, the content of cationic polymer is from 0.5% to 3.0% by weight, the anionic or amphoteric surfactant or mixture thereof content is from 2% to 8% by weight and the water content is at least 70% by weight; and
  - b: the pH of the aqueous developer is from 2.5 to 4.5, the peroxide oxidizer content is from 0.5% to 30% by weight and the anionic polymer content is 0.5% to 10% by weight.
3. A composition as in claim 1 wherein the developer contains from about 0.5% to about 12% by weight of hydrogen peroxide.
4. A composition as in claim 2 wherein the developer contains from about 0.5% to about 12% by weight of hydrogen peroxide.
5. A kit containing a two part aqueous composition which forms a gel on mixing of the two parts for coloring human hair comprising separate first and second containers:
  - a: the first container containing an alkaline aqueous lotion having a pH of from about 7 to about 11 containing from about 0.005% by weight to about 5% by weight of at least one primary intermediate and at least one coupler for the formation of oxidation dyes, from about 0.1% to about 5% by weight of a cationic polymer, from about 0.5 to about 15% by weight of an anionic or amphoteric surfactant or mixture thereof and at least 70% by weight water;
  - b: the second container containing an aqueous developer having a pH of from about 2 to about 6 containing from about 0.5% by weight to about 40% by weight of a peroxide oxidizer and from about 0.1 % by weight to about 20% by weight of an anionic polymer, the anionic polymer being characterized in that it is insoluble in the developer and dissolves in the gel which forms when the lotion and developer are mixed.
6. A Kit as in claim 5 wherein:
  - a: the ph of the lotion is from 9.0 to 10.5, the primary intermediate and coupler content is from 0.005% to 2.5% by weight, the content of cationic polymer is from 0.5% to 2.0% by weight, the anionic or amphoteric surfactant or mixture thereof content is from 2% to 8% by weight and the water content is at least 70% by weight; and
  - b: the pH of the aqueous developer is from 2.5 to 4.5, the peroxide oxidizer content is from 0.5% to 30% by weight and the anionic polymer content is 0.5% to 10% by weight.
7. A method of coloring human hair which comprises contacting the hair with a mixture of a two part aqueous composition which forms a gel on mixing of the two parts comprising:
  - a: an alkaline aqueous lotion having a pH of from about 7 to about 11 containing from about 0.005% by weight to about 5% by weight of at least one primary intermediate and at least one coupler for the formation of oxidation dyes, from about 0.1% to about 5% of a cationic polymer, from about 0.5% to about 15% by weight of an anionic or amphoteric surfactant or mixture thereof and at least 70% by weight water;
  - b: an aqueous developer having a pH of from about 2 to about 6 containing from about 0.5% by weight to about 40% by weight of a peroxide oxidizer and from about 0.1% by weight to about 20% by weight of a water insoluble anionic polymer: the anionic polymer being characterized in that it is insoluble in the developer and dissolves in the gel which forms when the lotion and developer are mixed and maintaining such contact until the hair is permanently colored.
8. A method as in claim 7 wherein:
  - a: the pH of the lotion is from 9.0 to 10.5, the primary intermediate and coupler content is from 0.005% to 2.5% by weight, the content of cationic polymer is from 0.5% to 3.0% by weight, the amphoteric surfactant content is from 2% to 8% by weight and the water content is at least 70% by weight; and
  - b: the pH of the aqueous developer is from 2.5 to 4.5, the peroxide oxidizer content is from 0.5% to 30% by weight and the anionic polymer content is 0.5% to 10% by weight.
9. A method as in claim 7 wherein the developer contains from about 0.5% to about 12% by weight of hydrogen peroxide.

**EP 0 640 335 A2**

10. A method as in claim 8 wherein the developer contains from about 0.5% to about 12% by weight of hydrogen peroxide.
